Now when it comes to cabling the trick is pretty simple to follow. As you do this your service loop will stay within a small 12 port width from it's closest patched and furthest patched quarter of the ports. There is a patching strategy I like to use when you are stuck using a box of 7 foot cables when all you really need are 3 foot cables. None the less, we all want it to look as neat as it can when we are done. I'm going to show you my practice when it comes to patching which can be easily modified. It covers LC connectors, LC patch cables, uniboot designs, armored and ultra-low-loss variants, LC adapters and patch panels, LC attenuators, MTP/MPO-to-LC cassettes, LC-interfaced transceivers, and LC media converters. It also includes practical selection guidance, real-world deployment scenarios. All the network drops to your various rooms end up at the patch panel. Here's a really simple topology: network drops > patch panel > patch cables >. Although a patch panel and a switch can look similar in a rack, they play very different roles in a structured cabling system. The aim is a stable, standards-compliant connection for secure data transmission in structured networks.
