A PoE (Power over Ethernet) switch performs multiple essential functions in modern networking by integrating both power supply and data transmission over a single Ethernet cable. That one fact is why a wireless access point on a ceiling, an IP phone on a desk, or a camera on a wall needs no power outlet next to it: the switch port that carries its traffic also powers it. This technology has revolutionized network infrastructure by eliminating the need for separate power cables, making installations simpler and more cost-effective. The splitter is the silver and black box in. Since its inception in 2003, PoE technology has evolved to offer more power and support an ever-expanding range of networked IP-based powered devices -- from VoIP phones, surveillance cameras, and Wi-Fi access points (APs) to LED lights, laptops, and digital displays. Successful implementation and.
