Terminal welding by means of resistance technology allows for connecting cable or braid strands to components such as terminals, plugs, welding rings and switches. Resistance welding can be used to process stranded wires with a cross-section of 0.1 mm² (micro range) up to 300 mm². During normal operation, the circuit of the distribution box can be switched on or off by manual or automatic switch. Various parameters in operation can be displayed by the measuring surface, and. ? From small electronics to heavy-duty power systems, properly welded copper wire terminals ensure safety, reliability, and performance.

With our systems for resistance terminal welding, you can create reliable connections between strands and terminals. Find more information [here](#).
